

What is claimed is:

1. A mobile communications system in a fixed wireless telephone network, which is configured by at least a fixed network local exchange, a wireless base station controller subordinate to the fixed network local exchange, and a plurality of wireless base station transceiver subsystems subordinate to the wireless base station controller, comprising

10 an inter-controller SW unit relaying voice data and control information, which are exchanged between the wireless base station controller and the plurality of wireless base station transceiver subsystems, between an arbitrary wireless base station controller

15 and an arbitrary wireless base station transceiver subsystem.

2. The mobile communications system according to claim 1, wherein

20 said inter-controller SW unit transfers the voice data and the control information, which are transmitted from the wireless base station controller to the plurality of wireless base station transceiver subsystems, with a broadcast communication.

25

00010955.073104

said inter-controller SW device determines a routing method for the voice data based on the received control information.

the wireless base station controller generates
10 control information based on an identifier of a base
station transceiver subsystem to which a mobile station
belongs, and/or an identifier of the mobile station,
and transmits generated control information to said
inter-controller SW unit.

the wireless base station controller performs hand-off control via said inter-controller SW unit based on voice quality information from a mobile station.

25 a plurality of inter-controller SW units are

connected by an optical communications path.

7. The mobile communications system according to claim 1, wherein

information is exchanged with an ATM
5 communication between the wireless base station controller, the plurality of wireless base station transceiver subsystems, and said inter-controller SW device.

10 8. The mobile communications system according to claim 7, wherein

voice data is exchanged with a composite cell.

9. A mobile communications method for use in
15 a fixed wireless telephone network, which is configured by at least a fixed network local exchange, a wireless base station controller subordinate to the fixed network local exchange, and a plurality of wireless base station transceiver subsystems subordinate to the wireless base
20 station controller, comprising

(a) relaying voice data and control information, which are exchanged between the wireless base station controller and the plurality of wireless base station transceiver subsystems, between an arbitrary wireless
25 base station controller and an arbitrary base station

00010955 073404

transceiver subsystem.

10. The mobile communications method according to claim 9, wherein

5 voice data and control information, which are transmitted from the wireless base station controller, are transferred to the plurality of wireless base station transceiver subsystems, with a broadcast communication in the step (a).

10

11. The mobile communications method according to claim 9, wherein

a routing method for voice data is determined based on the received control information in the step
15 (a).

12. The mobile communications method according to claim 9, wherein

the wireless base station controller generates
20 control information based on an identifier of a base station transceiver subsystem to which a mobile station belongs, and/or an identifier of the mobile station, and transmits generated control information via step (a).

25

2025 RELEASE UNDER E.O. 14176

13. The mobile communications method according to claim 9, wherein

the wireless base station controller performs hand-off control based on voice quality information from
5 a mobile station via the step (a).
